> #Use the t.test() function to conduct the hypothesis test to see

> #if there is a significant difference between the baseline

> #self-esteem scores and the post exposure self-esteem scores

> #Data is paired

> t.test(baseline, post, alternative="two.sided", paired=TRUE)

Paired t-test

data: baseline and post

t = -4.4737, df = 29, p-value = 0.0001092

alternative hypothesis: true mean difference is not equal to 0

95 percent confidence interval:

-4.760077 -1.773257

sample estimates:

mean difference

-3.266667
